Question 1

Practice calling methods
You will be given a Java program with 4 “clear box” methods.
Your tasks are

• to modify the main method of the program by writing code that tests each of the 4 methods by calling each method with 100 different parameters and printing the values that the methods return to the console.

• based on either inspection of the code itself or by studying the output of each method, provide comments clarifying what each method does.

• replace clearBox# with a name that is concise and descriptive of what the method does.

For this assignment you will need to examine the types of the inputs to the methods and the types of their returned values.
The 100 different test parameters should be generated in very few lines of code. hint. hint.
